CYBERSECURITY INTERNSHIP — PRACTICAL LAB REPORT

DAY 01: Passive OSINT & Reconnaissance Tool

Intern Name:	Md Peer Siddiqui	**Program:**	Alpha 2 — Cybersecurity Track
Issuing Body:	Sqrock IT Solution	**Date of Execution:**	October 20, 2026
Target Domain:	example.com (RFC 2606 Lab Target)	**Tool Developed:**	PEER'S OSINT Scanner v1.0

1. Curriculum Scope vs. Extra Engineering Delivered

Sqrock Prescribed Minimum Requirements	Extra Value & Engineering Implemented (PEER'S OSINT Scanner)
• Build basic Python OSINT script • Resolve domain DNS and WHOIS info • Query IP Geolocation endpoint • Output screenshot & 1-page report	• **Dual Target Engine:** Handles FQDNs & raw IPv4/IPv6 with reverse PTR • **Infrastructure Intelligence:** Autonomous System Number (ASN) & ISP • **Security Fingerprinting:** Automatically detects Cloudflare WAF / AWS / GCP • **Multi-Platform CLI:** Verified setup for Kali Linux, Windows & macOS • **Audit Export:** Automatically saves structured JSON deliverable in reports/

2. Passive Reconnaissance Intelligence Findings

Category	Observed Value	Security / Threat Implications
Target Host	example.com	Authorized RFC 2606 lab testing domain
Resolved IPv4	104.20.23.154	Anycast IP fronting Cloudflare edge infrastructure
WHOIS Registrar	RESERVED-Internet Assigned Numbers Authority	Identifies registrar ownership; renewal 2027-08-13
Name Servers	ELLIOTT.NS.CLOUDFLARE.COM HERA.NS.CLOUDFLARE.COM	Confirms authoritative DNS managed by Cloudflare
Geolocation	Toronto, Ontario, Canada (43.65, -79.38)	Identifies edge point of presence (PoP) location
Network / ASN	AS13335 (Cloudflare, Inc.)	Enterprise CDN protecting origin servers against direct DDoS
Security Posture	Cloudflare WAF / Reverse Proxy Protection	Direct port scanning on domain IP hits WAF, not origin server

3. Attacker vs. Defender Perspective

Adversary Perspective (Red Team / Social Engineering): Passive reconnaissance allows attackers to map target architecture without triggering Security Information and Event Management (SIEM) alerts. Identifying domain registrars and expiration windows enables domain squatting and spear-phishing prep. Uncovering ASN details reveals whether an organization relies on third-party cloud SaaS or on-premises servers.

Defender Perspective (Blue Team): Defenders must ensure WHOIS privacy is strictly enforced, audit public DNS records regularly, and verify that external cloud/WAF configurations do not expose origin server IP addresses.

4. Practical Execution Proof (Terminal Screenshots & Setup)

The following screenshots verify live execution of PEER'S OSINT Scanner against the authorized practice domain (example.com), as well as multi-platform installation documentation:
